MC100EL56

5V ECL Dual Differential 2:1 Multiplexer

The MC100EL56 is a dual, fully differential 2:1 multiplexer. The differential data path makes the device ideal for multiplexing low skew clock or other skew sensitive signals. Multiple V_{BB} pins are provided to ease AC coupling input signals.

The V_{BB} pins, an internally generated voltage supply, are available to this device only. For single-ended input conditions, the unused differential input is connected to V_{BB} as a switching reference voltage. V_{BB} may also rebias AC coupled inputs. When used, decouple V_{BB} and V_{CC} via a 0.01 μF capacitor and limit current sourcing or sinking to 0.5 mA. When not used, V_{BB} should be left open.

The device features both individual and common select inputs to address both data path and random logic applications.

The differential inputs have special circuitry which ensures device stability under open input conditions. When both differential inputs are left open, the D input will pull down to V_{EE}. The $\overline{D}$ input will bias around $V_{CC}/2$ forcing the Q output LOW.

- 440 ps Typical Propagation Delays

- Internal Input Pulldown Resistors on D(s), SEL(s), and COM_SEL
- Q Output will Default LOW with Inputs Open or at V_{EE}
